# Privacy Notice

Your reading is personal. How we handle your data should be clear.

DragonBooks iOS app - review draft
2026-10-15 · HU / EN

## 1. Who is responsible for your data?

Controller: Bősze Krisztián Viktor. Address: 1034 Budapest, Tímár utca 24., staircase A, floor 5, door 6, Hungary. Registration number: 60290733. Tax number: 90935554-1-41.

Privacy contact and requests: support@dragonbooks.app. This notice covers the DragonBooks iOS app, its account, synchronisation, membership and customer-support correspondence.

This notice explains what information DragonBooks uses, why it is processed, who receives it, and how you can request correction or deletion. Section 7 describes the limits of deletion from provider backups and technical logs.

## 2. Your account and personal reading journal

Account information: email address, display name, internal account ID, authentication and session data, and the version, language and time of acceptance of the Terms. Supabase Auth handles the password for email sign-in; never send passwords or sign-in tokens to customer support.

With Sign in with Apple, your account may receive the identifier and name/email you authorise Apple to provide. Sign-in also uses authentication data; the backend encrypts tokens needed to revoke the Apple connection. You may use Hide My Email. DragonBooks does not receive your Apple Account password.

Reading information: books and ISBNs, book metadata, categories, ratings and notes, reading instances, progress, reading time and sessions, weekly goals, statistics, shelf layouts, dragon and nest state, Amber/Lore, titles, tasks and badges.

These records relate to your own account. Your profile picture and uploaded book images are private by default. Content you select through a sharing feature is sent to the recipient/service you choose; that service’s terms also govern its further handling.

## 3. Images, permissions and local data

The camera can scan ISBNs and capture book images with a separate iOS permission. ISBN-scanning frames are not uploaded as book searches. Book lookup uses the recognised or manually entered ISBN.

We store resized versions of selected profile and book images in private Supabase Storage. Image processing produces a new image; original EXIF/GPS metadata is not included in the uploaded version. We do not copy your entire photo library to the server.

Reading reminders and countdown alerts use the iOS notification permission. The app schedules these locally; you can turn them off in the app and iOS settings.

Settings, caches, an active timer and pending sync operations may remain on your device. Session and sensitive authentication state are stored in iOS Keychain. Uninstalling the app alone does not delete data already synchronised to the server.

## 4. Membership and technical traffic

The App Store handles payments and Apple subscriptions. RevenueCat receives the internal DragonBooks account ID, purchase/product and renewal information, membership status and related dates, and store, currency, platform and SDK information used to operate the service. DragonBooks does not request payment-card details.

We do not separately send your name or email address to RevenueCat. Purchase information can nevertheless be linked to your account through its ID. The backend checks membership access, renewal, expiry, grace periods and revocation using verified provider information. RevenueCat also provides subscription reports.

Network requests necessarily expose technical information to providers, which may process IP addresses, request times and error status. Store country, interface language and the Chronicle region derived from device settings may differ. The app does not request GPS-based location access.

## 5. Why do we process the data?

Providing the account, reading journal, synchronisation and paid membership: performance of the requested service where necessary and applicable (GDPR Article 6(1)(b)). Security, access verification and abuse prevention: our legitimate interest in securing the service (6(1)(f)). Mandatory records and lawful official obligations: the applicable legal obligation (6(1)(c)).

You choose optional features. Where the law requires consent, it must be requested separately and can be withdrawn. Accepting the Terms or granting an iOS camera/notification permission is not blanket consent to personal-data processing.

We do not ask for special-category personal data. Book titles or notes can still touch sensitive topics: provide only content needed for your journal, and avoid other people’s confidential information. We do not use it to build political, religious or health profiles.

The app has no advertising SDK or cross-app advertising tracking. We do not sell your personal reading journal. Reading statistics and reward rules do not make solely automated decisions that have legal or similarly significant effects on you.

## 6. Providers and international transfers

Supabase Pte. Ltd.: account authentication, database, private image storage and server operations. The selected shared backend region is the United States. RevenueCat, Inc.: membership verification, purchase restoration and subscription reports. Apple: Sign in with Apple, App Store purchases and checking the store version.

ISBNdb receives the ISBN for book lookup; we do not send your account email or entire library with it. Loading external covers can expose network-request information to the image provider.

Resend (Plus Five Five, Inc.) delivers account-confirmation and password-reset emails, and replies from our support domain. It processes recipient addresses, message content and delivery information for this purpose. These messages do not subscribe you to a newsletter. Stored data is held in the United States; choosing a sending region does not move that storage.

Cloudflare, Inc. serves the dragonbooks.app website, public legal documents and app-opening information pages, and provides DNS and security services. Technical request information, such as IP address, requested path and browser information, may reach the provider. The web password-reset page does not request a new password; you set the password in the iOS app.

Cloudflare Email Routing forwards messages sent to support@dragonbooks.app to our business mailbox in Gmail. Both providers therefore receive sender and recipient addresses, message content and attachments. Replies from the support@ address reach recipients through Gmail and Resend SMTP.

## 6.1. International transfers

The public processing agreements of Supabase and RevenueCat include EU Standard Contractual Clauses for transfers outside the EEA and UK Addendum provisions for the United Kingdom. The public agreements of Resend and Cloudflare also include these transfer terms. Providers may process information in the United States; the server region does not mean that all support or technical information stays only there.

Apple, Google/Gmail and external content providers also describe their processing in their own notices. Contact us for information about DragonBooks-related transfers and safeguards, and copies of those safeguards. Section 10 provides links to provider documents.

## 6.2. Registration gateway

The Supabase registration gateway processes an aggregate declaration that the current registration requirements have been met, Terms acceptance information, and the authentication information needed to create an account or sign in with Apple. We do not send the full birth date, age band or separate parental checkbox value. This process relies on self-declaration; it does not verify actual age or a parent’s identity.

The gateway creates a single-use permit, valid for 60 seconds, bound to the email address or verified Apple identity. The stored binding is a keyed hash; the gateway does not write email addresses, Apple tokens, passwords or birth dates to its own technical tables. Earlier sections of this notice cover the authentication provider’s separate account records.

The attempt limit uses a similar hash binding and a 15-minute window. We remove permits when used or when the request finishes; account creation and account deletion also remove the related active gateway records. Scheduled cleanup processes expired records every minute. After an interrupted request or an outage, remaining records may persist until the next successful cleanup. This describes active records, not a deadline for erasing every copy in provider backups.

# 7. Retention and deletion

Account, library and reading: information needed to operate the service is processed while your account exists or, following a deletion request, until active-data deletion is carried out. You can correct editable information, start account deletion in the app or contact us for help. Requests do not require active membership.

Deletion removes the active profile, book and reading records, personal images, points, membership records and authentication account. The process also handles deletion of active RevenueCat customer information and revocation of the Apple sign-in connection. Network or provider failures may leave execution pending; the app confirms active-data deletion only after completion is verified.

Local information and deletion receipts: removal of app information linked to the account on that device is part of the process. Local and server receipts needed to resume deletion are removed upon successful finalisation. This may not remotely remove local copies on another device; you also need to manage app information and separately saved exports there.

Backups and logs: deleting active app information is distinct from immediate removal of every provider technical copy. Logs, backups, archives and some analytics copies can remain. The next page distinguishes known provider periods from unverified limits; we do not promise immediate erasure from every copy.

Support correspondence: we retain it for the time needed to handle and close the request. Further retention must be justified by a necessary, documented legal obligation or specific legal claim in that case; the necessary information and applicable period are determined separately. This does not mean retaining the full reading journal and does not restrict your deletion request.

Apple subscriptions: account deletion does not stop automatic App Store renewal. Manage cancellation separately with Apple. DragonBooks cannot independently delete Apple’s own purchase records.

## 7.1. Provider retention and limits of deletion

Supabase: the published Free-plan API and database log retention is one day. This is the plan’s log window, not a verified deletion maximum for every internal security log, backup or copy. The provider has not supplied a verifiable, single final deadline covering all internal copies linked to an individual user. Their lifecycle depends on the provider’s security and recovery systems, deletion/expiry rules and applicable obligations; deletion from the active database and storage does not prove their immediate absence.

RevenueCat: customer deletion is asynchronous. Technical copies may remain after verified absence from the active customer records. Reported periods are 45 days for SDK request logs, 30-day expiry rules for certain history files and recovery copies, and up to six months for some observability data. These are separate system periods, not a shared deadline starting from the deletion request.

Some RevenueCat audit and derived analytics copies do not automatically follow customer deletion. There is no verified final maximum covering every copy or end-to-end deletion certificate; we do not promise complete disappearance within six months. The provider has also not supplied a documented guarantee that prior deletions are reapplied before restored backup data can be served.

Resend: according to the provider, Free-plan email and log data is retained for 30 days and backups for seven days. These are system-specific periods, not a shared deadline for every copy after DragonBooks account deletion. Deleting an app account does not remove messages already delivered to the recipient’s own mailbox.

Cloudflare and Gmail: deleting an app account does not automatically delete information held in the support mailbox or web and email-forwarding systems. Our own support copies follow the necessity-based deletion process described above. We do not claim a verified shared maximum, measured from individual app-account deletion, covering every technical copy held by these providers.

## 8. Children and parents

DragonBooks is available from age 13; minors require involvement of a parent or legal guardian. Before registration and Sign in with Apple, which may create a new account, the app requests a birth date and prevents continuation when the stated age is under 13. The date is used only in memory for that check: it is not sent to the server or stored persistently. This is self-declared verification, not documentary proof of age or parental consent.

For a stated age of 13-17, the app requires a separate, initially unchecked box declaring a parent or legal guardian’s involvement. Without it, the app does not start registration or the Apple continuation. Changing the birth date clears the checkmark. We do not request a parent’s email address; the checkmark stays only in temporary memory and is not included in the Auth request or persistent storage. This declaration does not verify the parent’s identity or actual approval.

Parental involvement does not replace separate consent where local law requires it for the particular processing. Apple purchase approval and acceptance of the Terms are not general consent to personal-data processing either. The GDPR’s child-consent rule relates to consent-based processing; consent is not automatically the legal basis for every operation.

Parents or legal guardians may contact us for information, access, correction or deletion. Send only information needed for the request; do not send passwords or identity-document copies without a prior justified request. Promptly report the account and concern if you suspect unauthorised processing of a child’s data.

## 9. Your rights and contacting us

Under applicable privacy rules, you may request information and access, correction, deletion, restriction or portability, and object to processing based on legitimate interests. You may withdraw consent at any time without making prior lawful processing unlawful.

Email support@dragonbooks.app, preferably from the address associated with the account. Requests do not require a purchase or active membership. We may ask for necessary, proportionate identity verification to protect the account. GDPR requests are normally answered within one month; we will explain any justified extension.

You may complain to the competent privacy authority where you live or where processing takes place. In Hungary: National Authority for Data Protection and Freedom of Information (NAIH), 1055 Budapest, Falk Miksa utca 9-11.; naih.hu. Judicial remedies may also be available. This notice does not limit additional rights under local law.

A synchronised personal account requires the necessary account and authentication information. Profile pictures, camera use and notifications are optional; declining them affects the corresponding feature. Membership verification requires purchase and account-identifier data.

## 10. Updates and provider information

Updated notices carry a new version and date. Material changes require appropriate notice; publication does not constitute fresh consent. The Hungarian and English versions describe the same processing.
